

# ULTIMATE NON-INVASIVE SKIN RENOVATION WITH FRACTORA

THE TARGETED RF SKIN TREATMENT IS AN INVALUABLE ADDITION TO YOUR PRACTICE, CATERING TO AN EXTENSIVE RANGE OF SKIN CONCERNS.

From wrinkles and acne scars to pigmentation and skin texture, there aren't many skin concerns Fractora can't target.

A highly effective treatment for both superficial and deep dermal indications in the skin, the fractional radiofrequency (RF) skin resurfacing and rejuvenation treatment is just one part of the comprehensive InMode platform.

Distributed by High Tech Laser, the multi-purpose platform features multiple tip configurations to tailor treatments to patients' needs. A wide range of selectable treatment tip depths, tip density and variable energy levels allow each treatment to be customised to a patient's unique rejuvenation needs.

For Queensland cosmetic doctor Dr Ingrid Tall, the non-laser based technology is a versatile and valuable solution. "The platform offers multiple treatments in the same machine so it represents good value for money. The consumables cost is minimal and the machine itself is affordable," she says.

"It is easy to operate and to train other people and the training webinars online are also

comprehensive and educational," Dr Tall continues.

## Superficial to deep

Fractora works by delivering targeted bipolar RF energy to various depths in the skin to deliver effective results without the downtime, prolonged redness, or pigmentation changes associated with some resurfacing procedures.

The device works by delivering RF energy into different layers of the skin, producing localised heat and small micro-treatment dots in the targeted area.

Treatments include superficial skin concerns such as skin tone, texture, sun damage and fine lines, through to deep textural concerns such as deep wrinkles, scars and vascularities.

In addition to general facial rejuvenation and wrinkle reduction, the targeted treatment outcomes may include rejuvenation and tightening of skin around the jawline, neck, under the eyes, and on the cheeks and forehead.

"One of the major benefits for patients is that the downtime is

minimal. Patients often have a Fractora treatment on a Friday and they are wearing makeup the next day and back at work on the Monday. A long downtime is hard to sell to clients with their busy lives and they prefer three lighter treatments to one big gruelling recovery," explains Dr Tall. "The pricepoint is affordable for patients as well."

## Flexible & versatile

Fractora offers versatility previously only available by using multiple devices or excisional surgery. A wide range of selectable treatment tip depths, tip density and variable energy levels allow the user to vary the depth of ablation, coagulation and heating of each treatment so it can be customised to a patient's rejuvenation needs.

The versatile and flexible parameters allow the user to vary the depth of ablation, coagulation and heating. Fractora can provide non-ablative to minimally ablative results up to 1mm in depth.

"Everyone is looking for the 'natural' look, and fractional

## ONE PLATFORM – MULTIPLE TREATMENTS

Fractora is just one part of the five treatments offered by the InMode platform. The system gives clinics the unique flexibility to create a complete range of non-surgical solutions, for the face and body, with one device.

- **Forma and Plus** – non-ablative face and body skin tightening
- **Lumecca** – IPL for pigmentation and sun damage
- **BodyFX/Mini FX** – body contouring and cellulite treatment
- **Diolaze** – laser hair removal
- **RFAL** – Radio Frequency Assisted Lipolysis using BodyTite & FaceTite

resurfacing brings it all together. The spot treatments of Botox and fillers can look fragmented and unnatural if you don't improve the matrix or 'tablecloth' of the face, which brings it all together," says Dr Tall.

Fractora is also safe to use on ethnic skin with little risk of post-inflammatory hyperpigmentation.

## Patient satisfaction

Although treatment protocol differs between patients, generally at least three treatments are recommended to observe optimal results in skin rejuvenation.

"Some patients love it straightaway, after the redness settles and their skin feels smoother. For others, it's a much more gradual result, where they notice improved skin texture over a period of three to six months but can't pinpoint when the changes began," says Dr Tall.

"It is important to explain to patients that growing collagen and improving skin texture and tone is like watching grass grow and they have to be patient. It takes

around six weeks to begin collagen stimulation after treatment and often three months before you can see a difference. Also, you often need three treatments to see the difference and it is important to complete the course. We then recommend an annual re-treatment to maintain results."

The extensive range of skin treatments opens up a new set of possibilities for practitioners, and can essentially add another arm to a clinic.

"One treatment is never the 'answer' and you have to approach positive ageing from many directions to really kick your goals. We love Fractora for the more committed and serious devotees of anti-ageing, and most of our patients come back for more," Dr Tall concludes. **AMP**
